## EXPERIENCE

### Wake, Remote — *FinOps Analyst*

Feb 2023 - PRESENT

I brought the FinOps culture to Wake, working across 5 different products, both using AWS, evangelizing our developers and engineers to take responsibility. I work across 5 engineering teams using Slack and Meet, to coordinate improvements and optimizations into our cloud environment, like policies to improve our security and governance, resource reallocation and/or rightsizing, Savings Plans and/or Reserved Instances, and also some process related.

Also, I provide cloud cost visibility to the teams and help them understand and can develop strategies to improve visibility (like kubernetes pods cost).

I'm responsible for all Savings Plans, Reserved Instances, budgeting and forecasting related to AWS, coordinating between products, sales and infrastructure teams, so we can plan the expected environment changes and modernization plans.

I took care of the 2024 year vendor's budget, where I understood with our managers what each vendor is, where and how we use it, so we would use our commercial planning to create a more precise budget. It also included cloud vendors, where I created a full year forecasting, including our modernization and region reallocation plans.

### InventCloud, Remote — *DevOps Analyst*

Sep 2022 - Feb 2023

I built the FinOps area inside the company. As a consultant firm, one of my main tasks was to help their customers to understand the cloud costs, and see which services their products used. Part of the process was to create a tagging strategy, and correlate with the net revenue, so we could, together, understand the cloud performance.

I also had monthly meetings with their customers, where I could suggest optimizations and improvements after we analyzed cloud spending trends and patterns.

Between my tasks, I was a P.O./DevOps/SRE to a new app, that took the customer billing data from both 4 major cloud providers, put them inside a MySQL database (also created and managed by me), so we could use the PowerBI to create dashboards for their customers, and improve the analytics view. To that project, I

## MAIN STACK

AWS, Azure, GCP, OCI

AWS CUDOS, CloudHealth

Kubernetes

## SKILLS

Python, Bash

Slack, Notion

Azure DevOps

## LANGUAGES

Portuguese - Native

English - Advanced/Fluent

created a CI/CD at Azure DevOps, to deploy C# app, built into .net 6 core, to a Kubernetes cluster created using terraform on OCI (The cluster had two node pools, an ARM and X86 pool). I had a team with 3 developers and a Scrum analyst, while I managed all the other resources.

### **Zuri, Remote — CX Analyst**

Apr 2022 - Sep 2022

I was the N1 support analyst to the company's customers. I was the front line when the client ended the onboarding process, where I could coordinate with the internal project team each customer's necessity, and how we could personalize the customer's journey.

I worked with the customers providing and realizing troubleshootings and tips to solve and also prevent problems.

Along my support journey, I was a consultant to the customer's, helping them to design processes inside the tool and improve the server performance.

They had at the time, two sales options, a customer self hosted, and their hosting option on Azure. Part of the troubleshooting was inside the MS SQL that the app uses.

## **EDUCATION**

### **Uninove, São Paulo — IT Security Information**

Mar 2018 - Jun 2020

## **FURTHER EDUCATION**

### **The Cloud Bootcamp — MultiCloud Specialization**

Multicloud bootcamp with various hands-on labs, using AWS, Azure, GCP and OCI, including also DevOps labs, like a CI/CD pipeline on Azure to deploy resources on AWS.
